

How should Agentic SOC show that the agent is improving?

Four practical presentation options for daily operations, quality review, governance, and tuning suggestions - without inventing a score or claiming causality.

SHORT ANSWER

Use a **Daily Outcome Brief** for fast visibility and a **Quality Control review** for decisions. Add the Change Outcome Ledger only after bounded pre/post evidence is available.

What getting better should mean

Quality

- More analyst-reported agreement.
- Fewer material analyst corrections.
- Never combine these into a synthetic score.

Efficiency

- Lower human review turnaround.
- Keep its sample separate from graded cases.
- Do not present missing data as zero.

Safety

- Confirmed false negatives do not worsen.
- Fixed-horizon reopen rate does not worsen.
- Unavailable guardrails block promotion.

Evidence

- Compare complete UTC windows only.
- Show sample, coverage, exclusions, and truncation.
- Use observed association wording.

IMMEDIATE OPTIONS

Daily visibility and governed quality review

Recommended now: use the Daily Brief for visibility and Quality Control for the decision.

OPTION 1

Daily Outcome Brief

BEST FOR

Shift leads and standup

CADENCE

Daily

WHAT IT SHOWS

- Three headline metrics: decision agreement, correction rate, and review turnaround.
- Current 7 complete UTC days compared with the previous 28 complete UTC days.
- One plain-language status: improving, stable, collecting evidence, or needs attention.
- Sample count, comparable coverage, and guardrail state beside the summary.

OPERATOR ACTION

Open Quality Control for detail, or add the summary to the next standup.

TRADE-OFF

Fastest to understand, but intentionally hides cohort-level detail until requested.

OPTION 2

Agent Quality Control

BEST FOR

SOC managers and reviewers

CADENCE

Weekly or before rollout

WHAT IT SHOWS

- One operator-selected trend at a time: agreement, correction, or review turnaround.
- A review rail for sample sufficiency, comparable case mix, exclusions, and guardrails.
- A clear review result: eligible for controlled rollout, hold, or insufficient evidence.
- Definitions and exact denominators available through progressive disclosure.

OPERATOR ACTION

Approve a controlled rollout only when evidence and guardrails are both ready.

TRADE-OFF

More rigorous than the Daily Brief, but should not become a dense wall of simultaneous charts.

Change history and practical suggestions

Add these incrementally after evidence and approval history are durable.

OPTION 3

Change Outcome Ledger

BEST FOR

Governance and audit

CADENCE

Per change and weekly review

WHAT IT SHOWS

- A chronology of approved playbook, threshold, source, or policy changes.
- Before and after outcome snapshots with sample windows and guardrail status.
- Reviewer, version, observation period, rollback readiness, and final disposition.
- Supporting evidence links only when the backend can provide a bounded contract.

OPERATOR ACTION

Compare versions, continue observation, accept the change, or roll it back.

TRADE-OFF

Do not call a favorable post-change movement causal. Label it observed association until controlled evidence exists.

OPTION 4

Guided Improvement Queue

BEST FOR

Tuning operators

CADENCE

As proposals arrive

WHAT IT SHOWS

- Ranked suggestions such as correlation-threshold, playbook, or coverage improvements.
- Each suggestion states why it exists, the expected operational effect, and evidence still needed.
- Preview, test, approve, monitor, and rollback actions use the existing proposal workflow.
- Suggestions never make the deterministic close or escalate decision.

OPERATOR ACTION

Review the proposal, preview its impact, then approve, hold, or reject it.

TRADE-OFF

Actionable and practical, but expected impact is a hypothesis - not a guaranteed improvement.

A simple path from visibility to governed improvement

Keep the first release understandable. Use observed-outcome language and add depth only where it changes a decision.

PHASE	SHIP	WHY
Now	Daily Brief + Quality Control	Uses current aggregate evidence safely and gives operators an immediate decision path.
Next	Guided Improvement Queue	Turns reviewed observations into bounded proposals without changing deterministic authority.
Later	Change Outcome Ledger	Requires durable pre/post snapshots, review identity, versioning, and rollback evidence.

Decision rules

Eligible for controlled rollout

- Minimum sample threshold met.
- Quality and review turnaround move favorably.
- Guardrails are available and do not regress.
- Case mix and coverage remain comparable.

Hold for more evidence

- Sample or coverage is insufficient.
- A safety guardrail is unavailable or worsens.
- Source or severity mix changed materially.
- The bounded read was truncated.

Minimum metric definitions

METRIC	MEANING	FAVORABLE DIRECTION
Decision agreement	Analyst-reviewed decisions that match the agent verdict.	Higher
Material correction rate	Analyst-reviewed decisions whose verdict required correction.	Lower
Review turnaround	Time from human-review need to first qualifying human action.	Lower
Confirmed false negatives	Eligible reviewed cases later confirmed as missed true positives.	Not worse
Reopen rate	Closed cases reopened within the fixed follow-up horizon.	Not worse
